#### Abstract

Powder coating materials composed of (A) leaflet-shaped particles having a ratio of laminar diameter  $D$  to layer thickness  $d$ ,  $D:d$ , of from 100:1 to 10:1, comprising at least one leaflet-shaped effect pigment in complete or near-complete parallel orientation to the surface of the leaflet-shaped particles, and (B) transparent, dimensionally stable, non-leaflet-shaped particles or leaflet-shaped particles having a ratio of laminar diameter  $D$  to layer thickness  $d$ ,  $D:d$ , of  $< 10:1$  which are free from leaflet-shaped effect pigments. A process for preparing them, and their use.
